

EC type-examination certificate

Certificate no.: ABV 783/2

TÜV SÜD Industrie Service GmbH Notified body:

Westendstr. 199

80686 München - Germany

Applicant/ Chr. Mayr GmbH & Co. KG

Certificate holder: Eichenstr. 1

87665 Mauerstetten - Germany

Date of application: 2013-07-17

Manufacturer: Chr. Mavr GmbH & Co. KG

Eichenstr. 1

87665 Mauerstetten - Germany

Product: Braking device, acting on the shaft of the traction sheave, as

part of the protection device against overspeed for the car

moving in upwards direction

RSO 1300/896.30 .3 SO Type:

Test laboratory: TÜV SÜD Industrie Service GmbH

> Prüflaboratorium für Produkte der Fördertechnik Prüfbereich Aufzüge und Sicherheitsbauteile

Westendstr. 199

80686 München - Germany

2013-09-18 Date and number of test report: ABV 783/2

EC-directive: 95 / 16 / EC

Result: The safety component conforms to the essential safety

requirements of the Directive for the respective scope of application stated on page 1 - 2 of the annex to this EC type-

examination certificate.

Date of issue: 2013-09-19

> Certification body for lifts and safety components Identification number: 0036

> > Christian Rührmeyer

Annex to the EC type-examination certificate no. ABV 783/2 dated 2013-09-19

1. Scope of Application

1.1 Permissible brake moment when the brake device acts on the shaft of the traction sheave while the car is moving upward

4400 Nm

1.2 Maximum tripping speed of the overspeed governor and maximum rated speed

The maximum tripping speed and the maximum rated speed must be calculated on the basis of the traction sheaves maximum tripping rotary speed and maximum rated rotary speed as outlined in sections 1.2.1 and 1.2.2 taking into account traction-sheave diameter and car suspension.

1.2.1 Maximum tripping speed of the traction-sheave

460 min⁻¹

1.2.2 Maximum rated speed of the traction-sheave

400 min⁻¹

2. Conditions

2.1 Since the brake device represents only a part off the protection device against overspeed for the car moving in upwards direction an overspeed governor as per EN 81-1, paragraph 9.9 must be used to monitor the upward speed and the brake device must be triggered (engaged) via the overspeed governor's electric safety device.

Alternatively, the speed may also be monitored and the brake device engaged by a device other than an overspeed governor as per paragraph 9.9 if the device shows the same safety characteristics and has been type tested.

- 2.2 In order to recognise the loss of redundancy the movement of each brake circuit (each anchor) is to be monitored separately and directly (e.g. by micro switches, proximity switch). If a brake circuit fails to engage (close) while the lift machine is at standstill, next movement of the lift must be prevented.
- 2.3 In cases where the lift machine moves despite the brake being engaged (closed), the lift machine must be stopped at the next operating sequence at the latest and the next movement of the lift must be prevented. (The car may, for example, be prevented form traveling by querying the position of the micro switch which is used to monitor the mechanical movement of the brake circuits, should both brake circuits fail to open).
- 2.4 According to EN 81-1, paragraph 9.10.4 d a braking device must act directly on the traction sheave or on the same shaft on which the traction sheave is situated in the immediate vicinity thereof.

If the braking device does not act in the immediate vicinity of the traction sheave on the same shaft on which the traction sheave is situated, the standard is not complied with. In cases involving shaft failure in the extended area between the traction sheave and the braking device, safety would no longer be ensured by the latter if the lift car made an uncontrolled upward movement.

Note: The English text is a translation of the German original. In case of any discrepancy, the German version is valid only.

Shaft failure in the extended area must therefore be ruled out by appropriate design and sufficient dimensioning. In order to eliminate or reduce influencing factors which may lead to failure wherever possible, the following requirements must be satisfied:

- Minimization of bending length between traction sheave and braking device or traction sheave and the next bearing (the next bearing must form part of the drive unit)
- > Static defined bearing (e. g. 2-fold borne shaft) otherwise measures are required to obtain a defined loading
- As far as possible, prevention of a reduction in load-bearing capacity in the area of reversed bending stress (reduction in load-bearing capacity caused, for example, by stress concentration and cross-sectional reductions)
- > Between traction sheave and braking device the shaft must be continuous (made from one piece)
- Cross-sectional influences on the shaft are only permitted if they act on the following connections: traction sheave shaft, braking device shaft, torque of the transmitting component shaft (situated between traction sheave and braking device).

The manufacturer of the drive unit must provide calculation evidence that the connection braking device - shaft, traction sheave - shaft and the shaft itself is sufficiently safe. If necessary, evidence must be provided for the intended measures, too (see static undefined bearing).

The calculation evidence must be enclosed with the technical documentation of the lift.

3. Remarks

- 3.1 A code number will be inserted in the blank in the type designation RSO 1300/896.30_.3 SO according to the design (2 with hand release, 3 without hand release).
- 3.2 The permissible brake moment must be applied to the lift system in such a manner that they do not decelerate more than 1 g_n , if the empty car is moving upwards.
- 3.3 In the scope of this type-examination it was found out, that the brake device also functions as a brake for normal operation, is designed as a redundant system and therefore meets the requirements to be used also as a part of the protection device against overspeed for the car moving in upwards direction.
 - This type examination only refers to the requirements pertaining to brake devices as per EN 81-1, paragraph 9.10.
 - Checking whether the requirements as per paragraph 12.4 have been complied with is not part of this type examination.
- 3.4 In order to provide identification, information about the basic design and it's functioning and to show which parts have been tested pertaining to the tested and approved type, drawing no. E079 13 014 000 1 61 with certification stamp dated 19 September 2013 is to be enclosed with the EC type-examination certificate and the Annex thereto.
- 3.5 The installation conditions and connection requirements are presented or described in separate documents (e.g. assembly and operating instructions).
- 3.6 The EC type-examination certificate may only be used in connection with the pertinent annex and the list of the authorized manufacturers (according to enclosure). This enclosure shall be updated and reedited following information of the certificate holder.

Note: The English text is a translation of the German original. In case of any discrepancy, the German version is valid only.

Enclosure of EC type-examination certificate no. ABV 783/2 dated 2013-09-19
